

Changing the Enterprise Security Landscape

Abstract to the presentation:

Today, our enterprises face a growing number of sophisticated and highly targeted security threats, but have less and less visibility amidst the flood of data produced at each application and data layer.

Each IT architecture shift implemented by your business has made it harder to get a handle on the risks. As your business becomes more digital, outages have greater impact. And because of the limited visibility over your entire infrastructure and data overloads, the game of risk is becoming harder to play and more challenging to win. Brute force, throwing bodies at the problem, isn't going to work when we are dealing with 100 times the information we have today. So, the model of security we have now needs to be modernized. And our question to you is: What is the model and platform for securing your modern business in the next decade? What is the strategy that will make you win at the game of risk?
