Presentation title

How to trust in the Internet of Things? – An insight into uTRUSTit, an ongoing FP7 project on trust

Abstract

The Internet of Things (IoT) connects a large number of communication and information systems, becoming part of our everyday life. Its information security and privacy aspects, however, are often complex or hidden, difficult to understand for its users, eventually leading to their lack of trust. The uTRUSTit project works on a solution that displays security and privacy information in an interactive, customized way to various user types in the yet unfolding IoT environment.
